THREAD CONSUMPTION

The accompanying equations were compiled to approximate the total thread consumed in a seam, using any of the many varieties of stitch types. So that the equations might be flexible and applied to any given length of seam, they are shown for one inch of seam only, and may be multiplied by the length of the seam to determine the total thread consumed. When comparing the various equations with theoretical stitch types, there may appear to be an error. However, from actual thread consumption measurements, the equations have been proven to be reasonably close for general use. In developing the equations, simplifying assumptions were made which have been justified by actual test of thread lengths in many of the stitch types. Formulas for the amount of needle, looper, or cover thread in a particular stitch are impractical because the amount of these threads depends upon unknown factors, such as thread tensions, etc. It is possible, however, to approximate the total thread used, since changes in the amount of needle, bobbin and looper thread will change proportionately, leaving very little difference in the total thread used. Using the 301 stitch as an example, if the bobbin tension were set tighter than the needle thread tension, the thread loops would be pulled tight closer to the lower edge of the material. This would cause the use of more needle thread than bobbin thread. The total thread consumption, however, would remain the same. Of course, extreme changes in any of the tensions would destroy the stitch appearance and make the particular equation useless.

The second page of this booklet lists a complete summary of all the equations for each stitch type. The third and fourth pages have drawings which explain how a few of the equations were derived. Pages five through thirty-four contain graphs to show some of the more popular stitch types, with a reasonable range of stitch lengths and seam thicknesses.

As an example of the use of these graphs. let us take the 301 lockstitch on page 6. If the customer is sewing 10 stitches per inch, and across the stitching we measure an .060 inch thickness, the thread consumed every inch would be approximately 3.20 inches. This value can be multiplied by the seam length to determine the thread consumed on the full seam. The equations do not include thread used chaining off between garments.

It will be found when using the overedge stitches (the 500 series), that the percentage of error will be larger where there are fewer stiches per inch and smaller where there are more stiches per inch. This is due to the fact that the formula assumes the overedging to be practically paralleled, and when using few stiches per inch, say 3 or 4, the thread forms a diagonal and measures approximately 5 to 6% more than that calculated.

THREAD CONSUMPTION EQUATIONS

Where:

C = Total thread consumed per inch of seam
 W = Width of seam (overall)
 D = Distance between nearest 2 of 3 combined rows of stitches
 T = Thickness of material
 S = Stitches per inch (S.P.I.)
 N = Length of one stitch in inches
 S = 1/N = Stitches per inch
 If N = 1/8 then: S = 1/1/8 or S = 8 S.P.I.

1. The first step in the process of socialization is the family. The family is the primary agent of socialization. It is where we learn our first language, our culture's values, and our social norms. The family provides us with a sense of belonging and security, which is essential for healthy socialization.

2. The second step in the process of socialization is the school. Schools play a crucial role in shaping our educational experiences and our future careers. They provide us with knowledge, skills, and values that are essential for success in society. Schools also teach us how to interact with others and how to solve problems.

3. The third step in the process of socialization is the media. Media includes television, movies, music, and the internet. These sources provide us with information about the world around us and help us form our own opinions. However, they can also influence our behavior and attitudes.

4. The fourth step in the process of socialization is the workplace. Workplaces provide us with opportunities to apply what we have learned in school and at home. They also teach us about responsibility, teamwork, and communication. The workplace can be a source of stress and pressure, but it can also be a source of personal growth and development.

5. The fifth step in the process of socialization is the community. Communities provide us with a sense of belonging and support. They offer us opportunities to volunteer, participate in local events, and make a difference in our community. Community involvement can lead to personal satisfaction and fulfillment.
