一、Unpacking Machine

Unpack machine from its shipping box, making certain that you remove from box all component parts and accessories. Do not discard any packing material without prior scrutiny as to contents.

Clean from machine all greases, dirt, or dust.

Pay particular attention to area around the looper mechanism and looper.

二、Setting-up Machine

Assemble knee lifter lever to machine and place on sewing table so that lever is 13m/m distant from front edge of the table. Line up belt groove in belt pulley of handwheel with belt groove of drive mechanism (motor or clutch).

Mark three screw holes for fastening machine to sewing table and place felt pad under machine bed before machine is tightened down.

三、Install lining rack

Take out the lining rack. Fix it on the front part of the machine. Then install big and small pulleys device.

Notice: The distance between small pulley and workplate should be about 60mm. (Fig. 1).

Ref. Fig. 1

四、Handwheel Rotation and Speed

Turn handwheel only in direction away from operator for clockwise rotation. Be sure motor drive is wired up to obtain the same clockwise rotation. However, the recommended operating speed of a brand new machine is 1,300-1,500 stitches per minute. After a breaking-in period of several weeks and after the operator has become skilled in the operation of the machine, the speed can be increased up to 1,800 stitches per minute. (The electrical machinery with the rotational speed for 1400 Round/minute should be adopted)

五、Replacing Needle(Fig.2)

Turn handwheel away from operator (clockwise) until needle reaches the end of its return stroke (extreme left hand position). Adjust penetration dial to least amount of penetration (turn clockwise to wards 1).

Remove old or defective needle by loosening needle clamp screw. Insert new needle into seat in needle clamp as far as it will go. Tighten needle clamp screw.

Turn handwheel slowly away from operator and observe movement of needle. The curved portion of the needle should bear slightly on the needle guide groove in the left hand part of the presser foot.

Fig.2

六、Oiling and Maintenance

It is important to operate the machine before oil of good quality has been filled in each and every oil hole along the top of the machine. When breaking-in a new machine oiling should be done sparingly several times a day. Thereafter, one oiling daily will be sufficient. After oiling, wipe machine carefully to avoid soiling of the material.

Do not operate without material under the presser foot unless the knee lever is depressed. This will prevent damage to the needle and the feed dog as well as the feed plattens.

七、Threading Machine

Turn handwheel to machine in clockwise direction away from operator until needle carrier reaches its furthest lefthand position. Draw thread from spool on thread wiper, thread guide and needle clamp and then through the eye of needle from below upward. Pull about 5 cm of thread through the eye of needle. (Fig.3)

八、Sewing material feeding and sewing

1. Scissor the material, which makes the front material form triangle cloth with the length of 100mm(Fig.4)

Fig.4

2. Press the rod. Leave the space between presser foot and feeding material retainer. Rotate the belt wheel, which makes front and rear feeding teeth rise. Feed the material into the front part of the feeding teeth with feeding cutter. Then the material is carried to the rear part of the feeding teeth:(Fig.5)

Fig.5

3. Lining cloth is installed on the big bulley. (Fig. 1) Clamp the front part of the lining cloth with the clamp. Then above the main material. (Fig. 6)

Notice: The lining cloth needn't be used when mid-thick material trousers ears are made.

4. Check whether the position of the material and lining cloth are right. Start the machine slowly. Hold the material stably. Then begin to sew.

九、Continuous sewing

After sewing the material with the left length 20-30mm, you should stop operating the machine. Then put the awaiting material under the sewing material. Level the material. Start the machine slowly and sew it continuously. (Fig. 7)

十、Adjustment of Needle Penetration

The type of material to be blindstitched governs degree of needle penetration is required. It is, therefore, recommended to stitch a few centimeters as a test and make adjustments for penetration depending on the appearance of the trial stitching.

Turn regulator clockwise for less penetration and counter-clockwise for more penetration (Fig.8)

Fig.8

十一、Stitch Length Regulation

Stitch length adjustment can be easily effected by adjusting needle driving eccentric in arm.

Go about it as follows: (When the machine has no power)

Turn handwheel by hand pushing plunger until same is felt to drop into a recess within the mechanism inside the arm of the machine.

With the plunger remaining depressed into this recess continue turning the handwheel either forward or in reverse until the desired number of stitches per inch is visible on indicator. (Fig.9)

Fig.9

十二、Needle Recommendation

The recommended needle is system LW X 6T.

Size	Material
3(11)	Cottons,Silks,Acetates,Orion,Dacron and similar type of light weight fabrics.
3 $\frac{1}{2}$ (14)	Medium weight materials,Wollens and Others.
4(16)	Thick materials for coats,house furnishings.

十三、Taking out the sewed material

After sewing finished,stop the operation.Rotate the upper wheel clockwise,which makes the needle away from the material. Then press knee rod right,which makes the presser foot not press the sewed material.Pull the sewed material backward Quickly and lock the last stitch.Cut off the thread and take out the sewed material.

Notice:After finished sewing the thinner material,you had better cut off thread with a scissor.so that not broke the thin material.

十四、Machine regulation

1.Above blade regulation

Loose four fixed screws of the above blade.Regulate the top edge of the above blade to level the top edge of the support.Then twist the screw tightly(Fig.10)

Fig.10

2. Left, right cutters regulation

Rotate the hand wheel clockwise until cutters get to the bolt until the edge of the left and right cutters is 1mm above the lower edge of the above blade. Then twist the screws tightly. (Fig.11)

3. Trouser

Loose the screws and regulate the trousers ears sideways or horizontally to the edge of the roof surface or the middle. (Fig.12)
