I. Brief Introduction

WF-9205 Large Sewing Machine for Thick Material) adopts single needle and pendulum bobbin, composite feeding, cam cross thread and presser alternating lift structure. It is the large sewing machine for the extra thick material with good combination property. It applies to sew the extra thick material for shoemaking, sofa, leather case and leather.

II. Main Characteristic

It adopts the structure that the composite feeding, needle bar and press rod swing at the same time. The characteristic is: high precision of machine, high quality of sewing, it could ensure the up layer and down layer unshift in any length of stitch within the rated range when sewing the slippery material, sticky material and extra long products, so the products are neat and the line trace is beautiful. It also adopts cam to cross thread, especially when make the high-low sewing and climbing sewing, so the feeding is easy, the space of stitches is steady, the sewed layer is close, line trace is smooth and well proportioned. The complete machine has good property and complete oil-supply system, so it could increase the abrasion resistant extent of each part, reduce the noise, and prolong the service life of machine, It is the best machine for sewing extra thick products.

III. Main Technical Specifications

Speed of sewing	800R/Min
Length of stitch	12mm
Lifting height of presser	20mm
Model of needle	GV2 Model No. 110-280
When avale the presser the press the material:	
Thickness of material	≤16mm
Model of suture	Synthetie fiber wire 8/3, core wire 8/3, Braided thread 0.8
Ideotype of head	700×300×500
Power of electric motor	0.55KW (Special use for sewing machine)

IV. Use and Maintenance

1. Before use the new or long term stored machine, you must clean the dust and antirust grease on the surface, pour a few drop of oil into the running part or sliding part of sewing machine and make it running a few minutes.
2. When the machine turns, the turn direction of upper wheel should be anticlockwise (watch from the outside of the upper wheel).
3. The model of needle and the thickness of suture should be in direct proportion with the thick or thin, hard or soft of material.
4. Clean the dust and lubricate all the part at least twice of each work shift.
5. Within the first month of use the machine, the speed of sewing could not over 600R/Min.

V. Plan of Complete Machine

VI. Attachment

1	Bobbin winoler	1	7	Big knife	1
2	Bracket	1 set	8	Small knife	2
3	Chain	1 set	9	Oiler	1
4	Foot-plate	1	10	Needle	1 bag
5	" "Seat	2	11	Bobbin	5 bags
6	" "Bolt	4	12	Socket head cap screw spanner	1 set
			13	Belt hood	1 pcs
			14	Belt hood stand	1 pcs

VII. Samples of part

1. Body Unit

I. Body Unit

No.	No. of drawing	Name of Part	No.	No. of drawing	Name of Part
1	GO107	Cylindrical baseboard	28	GO100	Belt hood screw saddle $\Phi 10 \times \Phi 6.2 \times 40-2$
2	GQ106	Body upper segment	29	GL204	Belt hood nut
3	GS136	Body screw M30×35-4 Socket head cap screw	30	GS122	Belt hood 2 screw M4×7.5-2 plain screw

VIII. Operation Method and Adjustment

1. Installation of Needle

Turn the hand wheel by right hand, so the needle bar will go up the highest position; loosen the fastening screw of the needle, insert the needle with the handle above into the bottom of the hole of needle bar; when the long groove of needle towards left (facing outside), screw the fastening screw of needle.

2. Take out bobbin (Figure 1)

Turn the upper wheel, so the raising thread bar will go up the highest point, press the bobbin bolt (GN114) by right hand and move the bobbin case (GN115) by left hand, make it slope to outside, so the bobbin (GN116) will be taken out.

(Figure 一)

3. Coiling bobbin

Fix the bobbin winder on the right platen of machine. Drive belt drives the coiling wheel. When coiling, interlink the bobbin on the coiling post, push it into inside tightly, pull out the suture from the ball of string, cross the over thread ring and bracket on the bobbin winder; pull out the end of a thread from the hole at the upper of creel board and coiling a few circle on the bobbin. Press the bobbin by the full thread draw board, make the coiling wheel close to the drive belt, when the machine go into operation, the bobbin will be coiling automatically. When the bobbin is full, the coiling wheel will be separated automatically, the coiling is stop.

(Figure 二)

Must point out: when coiling, the machine can't sew.

4. Threading the Pendulum Bobbin (Figure 2)

Pull out a part of thread, and put the bobbin into bobbin case (GN115), press the end of thread under the butterfly spring (GN113), slide thread along the groove of bobbin case into the stick thread hold, then pull out the end of thread about 50mm from bobbin spring, at last, press the bobbin case fixed with bobbin will into the pendulum bobbin.

5. Threading the Facial Suture

When threading facial suture, the needle bar should be at the highest position, then extract the thread from a reel of thread, threading according to the following order:

- 1). Threading the extracted thread through the thread-passing ring ①, pass the bracket ② upward, through the thread-passing ring ③ downward;
- 2). Circle the thread-passing wheel ④ in counter-clockwise direction, through the raising-thread spring ⑤ upward;
- 3). Through the threading hole ⑥ of raising thread bar from left to right, pass the threading hole ⑦ on the panel downward;
- 4). Pass the thread from the inside of panel to the hole on the needle bar platform ⑧, at last through the needle hole from the front of needle, pull out the thread about 50-100mm for use.

6. Regulation of Suture's Tension

The tension of suture affects the quality of stitches directly. The correct suture tension should make the facial suture and the bobbin thread twisted in the middle of the sewing material (Middle Figure), if the facial suture tension is big, but the bobbin thread is small, the loose facial thread will be sewed in straight line on the surface of material (Upper Figure), otherwise the bobbin thread will be sewed in straight line (Under Figure). If the facial thread is nipped by two brackets, change the tension of facial thread by regulating the trapping nut (GLS204); change the tension of the bobbin thread by regulating the pressure of the butterfly spring.

(Figure 三)

7. Regulation of Presser's Pressure

Presser is used in helping the feeding tooth to push the material. The pressure of presser should be defined by the property or thick or thin of sewing material. If the presser is over, the sewing material will be cramped, if it is too small, it can not feed. When sewing thick material, turn the pressure regulated screw on the top of head in clockwise sense to increase the pressure; when sewing thin material, turn the pressure regulated screw on the top of head in counter-clockwise direction to decrease pressure.

8. Regulation of Stitch

As the different use of sewing material, the stitches must be adjusted. In general, the stitches should be large for sewing thick material, and small for thin or soft material. When regulating stitches, turn the stitch regulating blind sleeve (GZ132) in counter-clockwise direction, the stitches will become large; turn the stitch regulating blind sleeve (GZ132) in clockwise direction, the stitches will become small. When making back sewing, move the blind sleeve to the above of null line in counter-clockwise direction. If the stitches changed in the process of sewing, screw the spacing nut (GL204) of stitch seat at the back of machine.

9. Regulation of Height of Needle Bar

The height of needle bar is very important. If it is too high, the thread will jump, conversely, the thread will be broken. The new customer should better not move that, the professional person should adjust them if the unusual phenomenon occurs.

10. Adjustment of Height of Feeder

When the feeding tooth needs to be adjusted, loosen the screw under the feeding tooth, when it moves to the correct position, screw the bolt again.
